Complex of NS3 protease and NS4A peptide of BK strain hepatitis C
virus: a 2.2-A resolution structure in a hexagonal crystal form.*;
IL Protein Sci. 7:87-847(1998).
- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
- CATALTIC ACTIVITY: Hydrolysis of four peptide boads in the viral precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl.
- CATALTIC ACTIVITY: N nucleoside triphosphate +
                                                                                                                                                                                                                                                                                                                                                                                      01-AUG-1992 (Rel. 23, Created)

        {RNA}(N).
SUBDINT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                               SEQUENCE FROM N.A.

Genome polyprotein (Contains Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P4); Nonstructural protein
NS5B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RMa-directed RNA pollymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J8) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                             (RNA)(N).
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

-!- FUNCTION: MAY HAVE A FUNCTION IN MIGRATING CELLS.

-!- TISSUE SPECIFICITY: EXPRESSED IN BLOOD VESSELS. STRONGLY EXPRESSED

-- TISSUE CELLS, CYTOTROPHOBLASTS, AND POORLY DIFFERENTIATED COLON ADENOCARCINOMA CELLS POUND IN LYMPHATICS.

-!- SIMILARITY: Contains 8 WD repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gallardo J.A., Liotta L.A.; "Identification of a new immunoglobulin superfamily protein expressed in blood vessels with a heparin-binding consensus sequence.";

Lacono-Connors L.C., Schmaljohn C.S.;

Lacono-Connors L.C., Schmaljohn C.S.;

Cloning and sequence analysis of the genes encoding the nonstructural proteins of Langat virus and comparative analysis with other flaviviruses.

1. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein. commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

1. CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                        01-APR 1993 (Rel. 25, Created)
01-FEB-1994 (Rel. 28, Last sequence update)
01-FEB-1994 (Rel. 28, Last sequence update)
01-FEB-1003 (Rel. 41, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein);
ENVelope protein Rem: Marrix protein (Envelope protein M; Major
ENVelope protein E: Nonstructural protein NS1; Nonstructural protein
NS2A; Nonstructural protein NS2B; Helicase/protease (EC 3.4.21.98)
(NS3); Nonstructural protein NS4B; Nonstructural protein
directed RNA polymerase (EC 2.7.7.48) (NS5)].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN BYNTELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROPEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    "Sequence of the genes encoding the structural proteins of the low-virulence tick-borne flaviviruses Langat TP21 and Yelantsev."; Virology 185:891-895(1991).
                                                                                                                                                                                                                                                                                         Langat virus (strain TP21).
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                  [1]

-!- FUNCTION: TRANSFERRINS ARE INON BINDING TRANSPORT PROTEINS WHICH CAN BIND TWO ATOMS OF FERRIC IRON IN ASSOCIATION WITH THE BINDING OF AN BAILON, USCARABE FOR THE TRANSPORT OF IRON FROM SITES OF ASSORPTION AND HEND DECRADATION TO THOSE OF STORAGE AND UTILIZATION. SERMY TRANSFERRIN MAY ALSO HAVE A FURTHER ROLE IN STIMULATING CELL PROLIFERATION.

No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Nucleotide sequences of the genomic RNA of hepatitis C virus isolated from a human cariters comparison with reported isolates for conserved and divergent regions.";
J. Gen. Virol. 72:2697-2704(1991).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Characterization and mapping of a B-cell immunogenic domain in hepatitis C virus E2 glycoprotein using a yeast peptide library."; virology 200:246-255(1994).
-1- SUBDMIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

-!- SUBDNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                DB 12; Length 3011;

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

```
The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GlnAlaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyr 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antivitaal treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver fallure and NS3 NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-7 variant.

                                                                 g
                                                                                         ò
                                                                                                                                                                                                                        The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the PCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 81 SerProLysGlyProValThrGlnMetTyrThrAsnValAspLysAspLeuValGlyTrp 100

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3 NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the coding sequence for a fusion protein created using the Hepatitis C virus (HCV) NG3 and NG4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NG3-NG4A failure proteins which can be used to identify inhibitors of this type, as
                 Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

pestivirus genome where the Npro protease gene is replaced with NS3 protease gene, useful for in vivo screening of compounds which inhibit HCV infection
                                   Example 2; Columns 17-28; 20pp; English.
```

The present invention relates to a nucleic acid construct encoding a chimeric Hepatitis C virus (HCV)-peativirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a genome encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a function site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimeric clone of BVDV (bovine viral diarrhea The present sequence is a chimeric clone of BVDV (bovine viral diarrhe virus)/ECV NS3-wt, which was used to illustrate the present invention.

The present invention describes a covalent hepatitis C virus (MCV) NS4A NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 estine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present Sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent covalent complexes are more soluble, stable and active than the non-

                                                                                                                                                                                                                     603
                                                                                                           NS4A-NS3 complex comprising a central hydrophobic domain of native RCV NS4A-NS3 complex comprising a central hydrophobic domain, where the hydrophobic domain of native HCV NS4 serine protease domain, where the hydrophobic domain of native HCV NS4 peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the Arpsase activity of NS3. The covalent covalent covalent protease speptide complexes previously available.

                                                                                                                                                          NS4A NS3 complex comprising a central hydrophobic domain of native HCV NS4 Perptide, and an HCV NS3 serine protesse domain, where the hydrophobic domain of native HCV NS4 peptide is terbered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-PEPTIGE. and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 perine is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors by the protease activity, the helicase activity and the Arbase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.

This invention relates to a novel synthetic viral prototoxophore

```
comprising a toxin moiety operatively incorporated into a substrate

domain specific for a viral enzyme. This prototoxophore may be bound
and anodified by the viral enzyme. This prototoxophore may be bound
and anodified by the viral enzyme thus converting it to a toxophore.

Condition of the invention is a method for enhancing the anti-viral
effect of an antiviral agent, this method comprises contacting a cell,
infected with a virus or is susceptible to infection, with a
prototoxophore. The invention further comprises an assay to identify
anti-viral agents, comprising contacting an infected cell with a
candidate agent and comparing the ability of the agent to inhibit the
conforting way have virusing the ability of the agent to inhibit the
prototoxophores of the invention may be useful for reducing or
further cell, connective tissue cell, muscle cell (e.g. lymphocyte,
nerve cell, connective tissue cell, muscle cell or hepatocyte) which is
infected with a virus or is susceptible to infection with a virus, with
an effective amount of the prototoxophore. The cells are cell lines
adapted to long term continuous culture or isolated from a subject.
The prototoxophore is also useful for amellorating the severity of a
viral infection in a subject, where the virus is selected from human
immunodeficiency virus (HIV), herpes simplex virus (HSV), rhinovirus and
hepatitis virus, by administering an effective amount of the
prototoxophore to the subject. The prototoxophores of the invention are
also useful for treating tumours. The present sequence represents an
antiviral prototoxophore associated DNA sequence, this sequence is
the invention although in it is clearly not a protein in a protein and a prototoxophore is a recombinant with a protein prototion and antiviral prototoxophore is a recombinant with a protein and a prototion and antiviral prototoxophore is prototoxophore in a prototion and antiviral prototoxophore is prototoxophore in a prototion and antiviral prototoxophore is prototoxophore in a prototoxophore in a pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                122 ValThrArgHisAlaAspValileProValArgArgArgGlyAspSerArgGlySerLeu 141

                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present Sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NWR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPses activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
